

Business Cases

Business Case 1:

The HR department needs to process a list of employees to generate a report. They want to filter out employees who are not eligible for a bonus, sort the eligible employees by their salary in descending order, and then create a list of their names and bonus amounts. Additionally, they need to ensure that only employees with a non-null bonus are included in the report.

Business Case 2:

The marketing team wants to analyze the product catalog to identify the top-selling products. The products are organized into different categories, and the team needs a report showing the top 3 products in terms of sales for each category. If a product's sales data is missing, it should be excluded from the analysis.
